

AvePoint

PERIMETER

ENTERPRISE FILE SYNC & SHARE

Scenario

Suzy, your CEO, needs to share sensitive documents with Bob, a board member outside your organization.

However, all of your organization’s content resides within your on-premises Microsoft SharePoint environment and Bob does not have access.

Step 1

Suzy logs into Microsoft SharePoint as usual. She locates and selects the document library.

Step 2

In SharePoint’s ribbon, Suzy chooses the “Secure Share” option and sends Bob an invitation to edit the shared document library using AvePoint Perimeter.

Step 3

Bob receives an email, completes a short, one-time registration, and accesses Suzy’s document library via AvePoint’s Secure Portal.

Step 4

Within the Secure Portal, Bob is able to select and open documents through familiar, browser-based Office Web Apps (OWA).

Step 5

Based on the permissions set by Suzy, Bob can edit documents within OWA and save changes back to the SharePoint source destination – without ever having to download and re-upload documents.

End Result

Internal End Users

Suzy can easily share and collaborate on documents with external board members directly from SharePoint, just the way she would internally.

External Users

Without an extranet or federated access to Suzy’s actual SharePoint library, Bob is able to edit and share his changes quickly with Suzy.

Your Organization

Your SharePoint environment and content stays protected from external exposure and productivity is unimpeded – eliminating the need for unsecure, third-party sharing apps.
