

# Release Notes

**Product: DocAve® 4.5.2.2000**

**Release Date: April 24<sup>th</sup>, 2008**

**Package List:** Server Patch, Client Patch, ProDemo Packages

## Improvements and New Features

### Compliance

- **Compliance Auditor User Filter**

The Compliance Audit Report now has the ability to exclude users from being audited when configuring plans. Refer to the "User Exclusion" field in the Compliance Rule Builder -> Auditor tab.

### Migration

- **SharePoint 2003 to 2007 Backup Migration**

In order for customers with large environments to select data for migration, the "paging tree mode" has been implemented in this module. Large environments can now be split across multiple "pages" in the GUI.

## Bug Fixes

### General

- **Uninstalling Event Logs**

When uninstalling previous versions of DocAve, event logs needed to be removed manually from the DocAve host computer. This process has now been automated by the "Add/Remove Programs" tool under Windows.

- **WAS CE Availability Prompt**

Formerly, if DocAve was launched prior to the activating of IBM WAS CE for communication, a "404 error" would occur. Users are now prompted with information regarding the status of WAS CE when starting up DocAve initially.

## Known Issues

### Replicator

- **Two Way Replication of Workflows**

When performing Two Way Replication in DocAve's Administration module, users cannot select "workflows" in this replication process.

## Control Panel

- **SCOM Logging Setup**

After entering in all appropriate information to the SCOM settings tab of DocAve's GUI, users must select the "Apply" button *twice* after testing the configuration (ignoring the first "Your settings have been saved successfully" prompt). This will prevent you from losing any information entered in these fields. This only applies to the first-time SCOM logging settings.
